

## IQAir® Media Selection Chart for Gaseous Contaminant Control

**Important Note:** The actual indoor air quality improvements that can be achieved with air cleaning systems depend not only on the system's performance, but also on factors which are specific to that indoor environment. These include circumstantial factors such as temperature, humidity, contaminant mix, intensity of the contaminant and its source, the size of the indoor environment, the operating speed of the system, the number of air cleaners placed in the environment and the state of saturation of the individual filter elements. Although specific IQAir® media can be recommended for the control of certain contaminants, the manufacturer makes no claim as to the specific air cleaning results that can be achieved under the user's individual operating conditions.

**Waiver:** While the information contained in this list has been carefully compiled to the best of our present knowledge, it is not intended as representation or warranty of any kind on our part regarding the suitability of the products concerned for any particular use or purpose.
